# EXP.NO: 3 Write a Servlet program that prints "Hello, World!" when accessed through a browser.

**AIM:** To write a basic Servlet program that demonstrates the use of Java Servlets by printing "Hello, World!" when accessed through a browser.

**ALGORITHM:**

**Input:**

• The user makes an HTTP request (usually by entering a URL) through a browser.

Servlet Program Flow:

1. Create a Servlet Class:

o Define a Java class that extends the HttpServlet class.

o Override the doGet() method, which handles HTTP GET requests from the client (browser).

2. Handle HTTP Request:

o In the doGet() method:

- Get the PrintWriter object to write the response to the browser.
- Set the response content type to text/html.
- Write the "Hello, World!" message to the response.

3. Compile the Servlet Class:

o Compile the Java Servlet file using the javac command to generate a .class f ile.

4. Deploy the Servlet:

o Place the compiled servlet class file in the appropriate directory of the web application (typically in the /WEB-INF/classes folder).

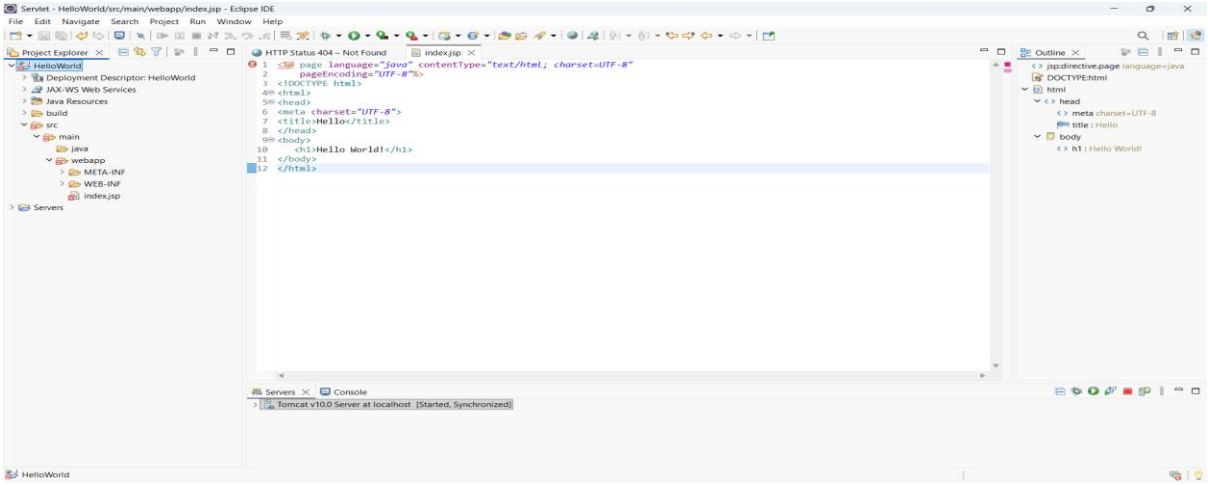
o Configure the servlet in the web.xml file of the web application or use annotations.

5. Access the Servlet via Browser:

o Start the Apache Tomcat or another servlet container.

o Access the servlet by entering the appropriate URL (e.g., http://localhost:8080/your-webapp/hello).

Code:



Output:

## Result:

The browser will display the message "Hello, World!" returned by the Servlet.
